THIRD INTELLIGENCE METHODS CONFERENCE

POTENTIAL CONTRIBUTION OF BEHAVIORAL SCIENCES TO INTELLIGENCE - SPEECH OUTLINE

My introductory remarks will concern three themes.

- a. Definition of the behavioral sciences as distinct from the social sciences with some comment on trends of potential significance in the behavioral sciences.
- b. The areas of intelligence in which behavioral sciences might play a role, e.g., in the research process for basic intelligence and in the estimate process.
- c. Specific ways in which behavioral scientists can add (and subtract) from the intelligence process.

If time permits, I will be happy to comment on the care and
feeding of this unusual breed, although I gather this will be discussed
in more detail during Session V To further amplify
the third theme of my speech, I will include my comments made
to the ONE Board pointing out the importance of determining not
only whether a political action is rational as distinct from patho-
logical but also whether it is internally consistent within the social and cultural environment and time domain. Some consideration con-
cerning new methodologies and techniques such as dynamic simula-
tions, behavioral modeling, and augmented computer capabilities to statistically analyze behavioral data should also be included.
